Subject: You're shortlisted to Round 3 of The Ken's Case-Build Competition
To: <muskan.sharma2027@mastersunion.org>

Hi Muskan ,

Congratulations! You're through to Round 3, and you stood out from a field of thousands of teams to get here. The finale is now in view: a share of the ₹20 lakh prize pool, plus a credit in The Ken's agentic map.

This round is harder. Only the top 10 teams across India will make it to the finale, so you'll really have to shine.

But it's also going to be the most fun round so far.

Run a simulation of your agent, then build the business around it

In Round 2 you designed your agent on paper. This round has two parts. First you run a simulation of your agent. Then you work out which company turns it into a business, and how.

You'll build the simulation, using a method called Wizard of Oz. The parts that can run, run. The parts that don't exist yet are played by someone behind a curtain.

Your agent is the part that runs. It's an AI model like Claude or Gemini, following a system prompt you write, and it makes every decision on its own. Wherever the model can connect to something directly, like Gmail, WhatsApp or Google Sheets, connect it. Everything else is played by a team member behind the curtain:

What your agent connects to

- **Gnani:** run the audio or text through Gnani's API yourself, and paste back exactly what Gnani returns..
- **Pine Labs and Delhivery:** reply with the response their documentation says they'd send.
- **Anything else from the outside world,** like a voice note arriving or the clock hitting 5 PM: a team member feeds it in. It must come from a real source. If no real source produces it today, your agent can't have it.

The person behind the curtain never helps the agent think. They only play the world around it. If your agent needs someone to tell it what to do next, it isn't an agent yet.

Recording your simulation

- Record your screen while your agent runs from the first thing that happens to the moment your agent's outcome is achieved.

- The recording must show every input arriving, every call your agent makes to Gnani, Pine Labs or Delhivery and the response that comes back, and every message your agent sends to a person.
- Keep it to 5 minutes at most. Fast-forward the parts where the model is thinking.
- Share the link, along with your system prompt and the name of the model you used.

Questions to answer

Part 1: Your agent

1. Tell the story of one person using your agent. Name them, name the date, and tell it in the order it happens, the way you'd explain it to a friend. Say what they see, what they say, and what your agent does in reply. 100 words at most.
2. Then list every decision your agent makes in the recording, in order. A decision is any point where your agent picks one thing over another. For each one, give:
 - When: the date and time.
 - What the agent received: the input that triggered the decision.
 - Where it came from: the connector, and the real source behind it.
 - What it decided.
 - Why: the rule in your system prompt it followed.
 - What it did or said, and to whom: the actual message or action, word for word.
 - Through what: the connector.
3. What does your agent know on day one, before anyone has used it? Who gives it that information, and how?
4. For every call your agent makes to Pine Labs, Delhivery or Gnani, name the exact endpoint from their documentation, and share the request and response. You can imagine up to 3 capabilities that don't exist yet. List them separately. For each one, name the partner, write the endpoint, and tell us what data that partner already holds that makes it possible.
5. Show us a mockup of every screen or conversation where your agent meets a person, whether that's a WhatsApp chat, a call script, an app screen or a notification.
6. Score each rail out of 10 on how agent-ready it is, and give one reason for each score.

Part 2: Build the business around your agent

If your agent works, which company turns it into a business, and how?

1. Where does your agent live, and how does a customer start using it?
 - Is it its own app, a feature inside another company's app (name the app), a WhatsApp number, or something else?
2. Which company should build it, and why them?
 - What do they already have that nobody else does?
 - Why haven't they built it yet?
3. Who will they sell it to, and how will they make money from it?
 - What do those customers do today instead, and what does that cost them?
 - Will the customer pay, or will the company earn from something else, like more orders?
4. How will the agent get its first 1,000 users? This is the question we care about most, so be as inventive as you like.
 - Where do these people already spend time, and what gets someone to try it the first time?
 - What keeps them using it after three weeks?

5. Make the landing page for the agent the way the company you named in question 2 would, with a call to action to sign up, and share the link.
6. What could kill this agent in its first year?

When to submit

Submissions close by Sunday, 4 October, 11:59 PM IST. The submission portal isn't live yet. We'll email you once it opens, so keep an eye on your inbox and the site. In the meantime, start early. Getting an agent to run takes longer than designing one.

The strongest agents from this round go to the finale. You'll show yours working in front of a jury, with a ₹5 lakh first prize and more prizes to play for.

We can't wait to see your agent run.

If you have questions, write to adhavan@the-ken.com.

All the best,

Adhavan RK
